Part of Paper No. 20050826

Continuation of 11. does NOT place the application in condition for allowance because: Applicant's argument is not persuasive; because the UIM is network interface (see Col. 48, lines 51-56,-Col. 51,lines 2-30), which requires netowrk address for communication with other device in a network, thereby network address is inherent. In addition, since the UIM is receiving packets from a network, the packets include network address which facilitates the routing of the packet to the approprite interface. As indicated in applicant's argument, Hemmady teaches FIFO registering packet corresponding to the UIM, which is inherently registering packets based on network address that is inherent in the UIM. With respect to Hemmady teaching away, the argument is also not persuasive, because, the claim in call for network address, of the outbound packet, without specifying the particular network asddress. Conventionally, data packets regardless of being inbound or outbound, contains two addresses, i.e., source and destination, which would read on network address as claimed. Further argument in the dependent claims would not place application in the allowable condition, without including in their parent claims. If applicant believes that the limitation is allowable, examiner suggests that applicant should place in their parent claims at the time of filling continuation. The prosecution is closed.
